

## Pharmacy Portal System - Project Report

This Pharmacy portal system is a web-based application designed to let pharmacists view inventory and prescribe medication while allowing patients a secure way to view their prescriptions. Developing this has been a lot of work for me, but I learned a lot of valuable lessons. One of the challenges I faced a lot during coding was typos. I spent hours looking for what code went wrong when it wasn't even the code's fault, it was because I messed up spelling the file it was residing in. These experiences reinforced the importance of going slow and checking one's work.
